

## **ABSTRACT OF THE DISCLOSURE**

A method for a video call receiving service in a mobile communication system is disclosed, in which a video call and a voice call can be distinguished using a sub-address of the mobile communication system and a user is able to receive the call selectively. The method includes transmitting a message, including a sub-address corresponding to either a voice call and a video call, from an origination terminal to a destination terminal. A call is connected between the origination terminal and the destination terminal in accordance the sub-address received by the destination terminal. The video call and the voice call are distinguished through the sub-address, the user is able to receive the call selectively, and the connection of the respective call can be automatically performed, thereby reducing the processing load on the system.
